

# EARTHZYME SOIL STABILIZER

APPLICATION: CURRIES LANDING ROAD, CORNWALLIS, MB

These photos were taken Fall 2018 from Curries Landing Road in the Rural Municipality of Cornwallis, MB (near Brandon). This haul road, which is a main road to 6 gravel pits and sees 300+ loaded trucks a day, was treated with EarthZyme in 2015, so 4 full seasons of little annual maintenance and exceptional dust control and stabilization. As you will see, the road is like concrete. The Brandon University tried using a core drill but it wouldn't drill the surface. They used a concrete saw instead. This road will perform for many more years to come.

- Significant reductions in maintenance & operational costs
- Grading reduced from 2-3 times per week prior to 2015 to once every 2 years!
- No need to replenish gravel
- Eliminate the need to apply dust control, significant reduction in labour and equipment costs
- Annual water costs of \$40,000 eliminated since the 2015 EarthZyme application
- They have since treated 7+ more miles of roads with EarthZyme
